

SIMPLIFIED PIPE SUPPORT ASSEMBLY

ABSTRACT OF THE DISCLOSURE

A plastic pipe support assembly includes a pair of snap-on wall brackets or fittings with each bracket or fitting including a base portion and a snap-on, pipe receiving portion. The base portion includes holes for receiving nails or screws for mounting to studs in a building, for example; and the snap-on pipe receiving portion includes a pair of jaws for extending around a support pipe, with the opening between the jaws having a spacing which is less than the diameter of the support pipe so that the support pipe may be snapped into the jaws, and held firmly in place. One or more pipe-to-pipe fittings may be provided with each fitting having a pair of pipe receiving jaws, for mounting water pipes to the support pipe. The support pipe and the brackets or fittings may be all formed of the same type of plastic as the water pipe, such as polyvinyl chloride, or chlorinated polyvinyl chloride. Plastic solvent may be employed to bond the pipes and fittings together.
